(57) Abstract:

SOLUTION: Same terminal main bodies can be used as terminal main bodies 1 even for systems whose users are different. In security modules 2 to be used in a system A, modules in which master keys As and functions (fs) are used are used and in security modules 2a to be used in a system B, modules in which master keys Bs and functions (gs) are used are used for the common main bodies 1. Then, respective terminals 10, 10b for system A, system B can be constituted by building up security modules different in respective systems in common terminal main bodies. Thus, master keys and algorithms are never abused by being decoded illegally from the outside and the high security of this system is kept.
